                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          /note⇒ "encoded by AAN where N indicates a gap of 0.5 kb"
                                                                                                                The present invention relates to methods and compositions for enhancing cardiac function in mammalian hearts by inserting transgenes encoding beta-adrenergic signalling proteins (beta-ASP) which increase beta-adrenergic responsiveness within the myocardium using in vivo gene therapy. The beta-ASPs of the invention include beta-adrenergic receptors (beta-AR), adenylytoyclases (also referred as adenylate cyclase and cAMP synthetase) and G-protein receptor kinase (GRK) inhibitors. The beta-ASP is used for enhancing cardiac function in mammalian hearts and for treating heart disease, especially congestive heart failure. The present sequence is a human gardiac adenylcyclase VI (ACVI) isoform which is used for generating a third beta-ASP transgene, used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human; adenylylcyclase VI; AC-VI; beta-adrenergic signalling protein; transgene; gene therapy; congestive heart failure; cardiac function;

The present sequence represents human adenylylcyclase isoform VI (AC-VI)

from the present invention. The present invention describes a
recombinant replication-defective viral particle (I) comprising a gene
encoding a beta-adrenergic signalling protein (beta-ASP) operably
linked to a promoter. Also described are: (I) a recombinant pro-viral
plasmid (Ia) comprising, a gene encoding a beta-ASP, as above, operably
inked to a promoter and further comprising a replication-defective
viral genome; (2) a (mammalian) cell transfected with (I) or (Ia); (3)
an isolated polynuclectide comprising a sequence encoding a human
solated polynuclectide comprising a variant having AC activity;
(4) a human AC-VI encoded by (3); (5) an isolated polynuclectide
sequence which hybridises at high stringency to (3); and (6) a vector
comprising the polynuclectide of (3). (I) can be used to form a
filtered adenovirus particle preparation. (I) is used to enhance
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö

compositions for enhancing
                                                                                                    The present invention relates to methods and compositions for enhancin cardiac function in mammalian hearts by inserting transgenes encoding beta-adrenergic signalling proteins (beta-ASP) which increase beta-adrenergic responsiveness within the myocardium using in vivo gene therapy. The beta-ASPs of the invention include beta-adrenergic receptors (beta-AR), adenylytoclases (also referred as adenylcyclase) adenylate cyclase and cAMP synthetase) and G-protein receptor kinase (GRK) inhibitors. The beta-ASP is used for enhancing cardiac function in mammalian hearts and for treating heart disease, especially modified cardiac adenylcyclase VI (ACVI) isoform which is used for generating a beta-ASP transgene, used in the exemplification of the
Novel polynucleotide encoding a modified adenylylcyclase polypeptide useful for enhancing cardiac function in mammalian hearts, and for treating heart disease, especially congestive heart failure -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                   1 MSWFSGLLVPKVDERKTAWGERNGQKRSRRRGTRAGGFCTPRYMSCLRDAEPPSPTPAGP 60
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Newly isolated and purified human type VI adenylyl cyclase (hAC6) polypeptide - useful for identifying potential therapeutic agents that modulate hAC6 activity, and for the diagnosis of hAC6-associated diseases and disorders
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         This is the amino acid sequence of human type VI adenylyl cyclase
                                                                                                                                                                                                                                                                                                                                                                                                Length 1167;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Adenylyl cyclase type VI; human; hAC6; therapy; diagnosis.

                                                                                                                                                                      The present invention relates to methods and compositions for enhancing cardiac function in mammalian hearts by inserting transgenes encoding beta-adrenergic signalling proteins (beta-ASP) which increase beta-adrenergic responsiveness within the myocardium using in vivo gene therapy. The beta-ASPs of the invention include beta-adrenergic receptors (beta-AR), adenylylcyclases (also referred as adenylcyclase, adenylate cyclase and cAMP synthetase) and G-protein receptor kinase (GRK) inhibitors. The beta-ASP is used for enhancing cardiac function in mammalian hearts and for treating heart disease, especially congestive heart failure. The present sequence is a human cardiac adenylcyclase VI (AVVI) isoform which is used for generating a third beta-ASP transgene, used in the exemplification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Novel polynucleotide encoding a modified adenylylcyclase polypeptide useful for enhancing cardiac function in mammalian hearts, and for treating heart disease, especially congestive heart failure -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       0; Gaps

            AAX00461). hACG is expressed mainly in the heart and brain. It has a similar putative structure to other adenylyl cyclase isoforms but, like type V, is distinguishable in that it has a larger.

N-terminus and a relatively shorter C-terminus as it larges the C2b region. The invention relates to the hACG gene, methods for the crombinant production of purified hACG and the proteins made by these methods, antibodies against hACG, vectors, probes and host cells (especially HEK-293) transformed by genes encoding polypeptides having hACG activity, along with diagnostic and therapeutic uses for these various reagents. hACG can be used as a cool to screen for agonists and antagonists that stimulate/inhibit chacG. Such compounds have therapeutic utility in treating diseases caused by aberrant activity of this enzyme, and diseases whose scrivity of hACG.
                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Novel polynucleotide encoding a modified adenylylcyclase polypeptide useful for enhancing cardiac function in mammalian hearts, and for treating heart disease, especially congestive heart failure -

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             δ
```

The present invention relates to methods and compositions for enhancing cardiac function in mammalian hearts by inserting transgenes encoding

```
A canine heart cDNA library was constructed in lambda gt10 and was screened with a 970 bp AatI-HincII fragment from type I adenylyl cyclase cDNA probe (encodes the first cytoplasmic domain of adenylyl cyclase, which has significant homology to other previously known types of adenylyl cyclase). One positive clone, of 5.4 kb was obtd. Positive colonies were subcloned into pGU18 and further subcloned and sequenced bidirectionally. The 5.4 kb clone was used to rescreen the library and on averlapping clone contg. the 5' end of the gene was isolated. Together the two clones cover the complete cannine cardiac adenylyl cyclase gene. The gene is suspected of being involved in the regulation of cardiac function and it is thought that decreased activity of adenylyl cyclase in the heart may be a
beta-adrenergic signalling proteins (beta-ASP) which increase beta-adrenergic responsiveness within the myocardium using in vivo gene therapy. The beta-ASPs of the invention include beta-adrenergic receptors (beta-AR), adenylylcyclases (also referred as adenylcyclase, adenylate cyclase and cAMP synthetase) and G-protein receptor kinase (GRK) inhibitors. The beta-ASP is used for enhancing cardiac function in mammalian hearts and for treating heart disease, especially congestive heart failure. The present sequence is a human cardiac adenylcyclase VI (ACVI) isoform which is used for generating a fourth beta-ASP transgene, used in the exemplification
                                                                                                                                                                                                                                                                                                            Gaps

                                                                                                                                                                                                Qγ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention describes a method for examining ischaemic conditions, comprising measuring the expression levels of particular genes (I) in a test sample or determining the expression profile of a gene group in the sample comprising genes selected from (I). The method is useful for examining the ischaemic condition (e.g. compressive ischaemia or vasospastic ischaemia) by measuring expression levels of particular genes (BB199102 to AB199912, encoding the protein sequences in ABB57020 to ABB57374) or by determining the expression profile of a gene group comprising these genes are used as an indicator when screening for ischaemic condition-improving represent PCR primers for a mouse ischaemic classases. AB199913 and AB199914
                                                                                                5
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Examining the ischemic condition (e.g. occlusive ischemia) by measuring expression levels of particular genes defined in the specification or by determining the expression profile of a gene group comprising these

Separation and purification of the recombinant enzyme is much easier compared with wild type enzymes and the recombinant enzyme is more stable than the wild type enzymes and the allows easier screening of compounds that stimulate and inhibit Adenylyl cyclase activity. The recombinant adenylyl cyclase comprises a chimmes of adenylyl cyclase (2 and (2 domains linked covalently). The domains may be linked by a linker peptide. The recombinant adenylyl cyclase is useful for screening inhibitors and stimulators of adenylyl cyclase activity. Inhibitors of the enzyme are useful for treating cholera, pitultary tumors, heart failure, ischaemia, endocrine disorders and cell necrosis. Stimulators of adenylyl cyclase are useful for treating pseudohypoparathyroidism and other
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Novel soluble mammalian polypeptide composition comprising adenylyl cyclase activity for screening stimulators and inhibitors of adenylyl
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

                                                                                                                                                                                              qq
                                                                                                                                                                                                                                                                                             AAW18657 and AAW18658 are +1 and +2 frameshift mutations, respectively, of a sequence comprising fragments of the coding sequence of the human neurofilament subunit NF-LOW (NF-L) gene corresponding to nucleotides (nt) 1-420 followed by nt 901-1440 of the wild-type NF-L gene. These regions of the gene contain GAGAG motifs. Frameshift mutants of the teau, ubiquitin, apolipoprotein E, microtuble-associated protein 2 (MAP-2), neurofilament subunit L, M and H and amploid A4 genes are claimed. All these genes share a common GAGAN motif (N* A, G, C or T), which is the site of common GA dinucleotide deletion(s) that cause neurodegenerative disorders. Antiquence peptides used for the production of antibodies, and small nucleic acid sequences derived from frameshift
                                                                                                                                                                                                                                                             Frameshift mutation product, GAGA motif; somatic mutation; diagnosis; detection; antibody; probe; cancer; neoplasia; neurodegenerative; Parkinson's; Alzheimer's disease; Pick's; Huntington's disease; Down's syndrome; frontal lobe dementia; progressive supranuclear palsy; PSP; amyotrophic lateral sclerosis; multiple sclerosis; MS; cardiovascular; rheumatoid arthritis; NF-L; neurofilament-low.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       mutants are used in the diagnosis, prevention and treatment of cancer and neurodegenerative diseases, e.g. Parkinson's disease, Alzheimer's disease, Down's syndrome, frontal lobe dementia (Pick's disease), progressive supranuclear palsy (PSP), amyotrophic lateral sclerosis, Huntington's disease, multiple sclerosis, and other degenerative

The invention relates to isolated polynuclectide (I) and probes, polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chair reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The cand gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags completely in gene therapy techniques completely in gene therapy techniques concepted for generating antibodies against it, detecting or constore normal activity of (II) or to treat disease states involving consistency of (II) are useful for generating antibodies against it, detecting or constituting a polypeptide in tissue, as molecular weight,markers and as a food supplement. (II) and (II) and (II) are useful for treating consistency involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in cappositics, forensics, gene mapping, identification of mutations consists, forensics, gene mapping, identification of mutations and to produce other types of data and products dependent on DNA and canno acid sequences. ABG00010-ABG30377 represent novel human call diagnostic amino acid sequences of the invention.

clone pMptb #48 and represents a 36K antigen of Mycobacterium paratuberculosis. The DNA sequence and its fragments are useful as hybridisation probes and amplification primers for detecting nucleic acid specific for the genus Mycobacterium, particularly for diagnosis of infection, especially by M. paratuberculosis which has been implicated in Crohn's disease and sarcoidosis. The 36K protein is useful in serological diagnosis and for vaccine development.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The
                                                                                                                                                                                          The present sequence is encoded by the BamHI-DNA insert of recombinant
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  DERKTAWGERNGOKRSRRRGTRAGGFCTPRYMSCLRDAEPPS-----PTPAGPPRCPWOD 67

for identifying expressed genes. (15) is useful in gene therapy techniques for restore normal activity of (11) or to treat disease states involving (11). (11) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (11) and its binding partners are useful in medical imaging of sites expressing (11). (1) and (11) are useful in medical insorders involving aberrant protein expression or biological activity. The polypeptide and polynuclectide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations or responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences. ABG00010-ABG30377 represent novel human diagnostic amino acid sequences of the invention.

Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO at the wipo int/pub/published_pct_sequences.
polynucleotides are also used in diagnostics as expressed sequence tags
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Sequence 1076 AA;
